Significant risks that should be fixed as soon as possible.

3	12	9
Action required	Needs attention	Passed

Computer	FRONTDESK-01 · Dell Inc. OptiPlex 7010
Windows	Microsoft Windows 11 Pro (build 22631)
Network	Workgroup: WORKGROUP
Scanned	Oct 16, 2026 9:45 PM as FRONTDESK-01\reception

Top priorities

1. **Hard drive is encrypted (BitLocker)** HIGH
   If the laptop is lost or stolen, files cannot be read without the key.
   Fix: Turn on BitLocker (Settings > Privacy & security > Device encryption, or Control Panel > BitLocker) and save the recovery key somewhere safe OFF the computer.

2. **Firewall is on for every network type** HIGH
   Blocks attackers on the same Wi-Fi or network from reaching the PC.
   Fix: Windows Security > Firewall & network protection > turn on the firewall for Domain, Private and Public networks.

3. **Password minimum length** MEDIUM
   Short passwords can be guessed or cracked in minutes.
   Fix: Set a minimum of 12 characters: run as admin net accounts /minpwlen:12 (or via Group Policy / Intune for business accounts).

4. **Windows version is still supported** CRITICAL
   Unsupported Windows no longer gets security fixes.
   Fix: Settings > Windows Update > install the latest Windows 11 feature update.

5. **Security updates installed recently** HIGH
   Most attacks exploit holes that already have a free fix.
   Fix: Settings > Windows Update > Check for updates, install everything, and restart.

6 **Remote Desktop is secured** HIGH

Exposed Remote Desktop is a top way ransomware gangs break in.

Fix: If not needed, turn it off (Settings > System > Remote Desktop). If needed, make sure port 3389 is NOT open on the router - use a VPN instead.

7 **Everyday account is not an administrator** HIGH

Malware gets full control of the PC if the user who opens it is an admin.

Fix: Create a separate admin account for installs, and change the everyday account to a Standard user (Settings > Accounts > Other users).

8 **Credential theft protection (LSA)** MEDIUM

Makes it much harder for attackers to steal saved passwords from memory.

Fix: Windows Security > Device security > Core isolation > turn on "Local Security Authority protection", then restart.

Detailed results

Malware protection

STATUS	CHECK	RISK
Pass	**Antivirus is installed and running** Active: Windows Defender	CRITICAL
Pass	**Virus definitions are up to date** Definitions are 1 day(s) old.	HIGH
Pass	**Tamper Protection is on** Tamper Protection is on.	MEDIUM
Needs attention	**Credential theft protection (LSA)** LSA protection is not enabled. **How to fix:** Windows Security > Device security > Core isolation > turn on "Local Security Authority protection", then restart.	MEDIUM
Needs attention	**Remote-access tools review** Installed: AnyDesk **How to fix:** Confirm every remote-access app listed is known and approved. Uninstall any nobody recognizes and change passwords used on this PC.	MEDIUM

Updates & system

STATUS	CHECK	RISK
Needs attention	**Windows version is still supported** Microsoft Windows 11 Pro build 22631 is an older Windows 11 version that may no longer receive updates. **How to fix:** Settings > Windows Update > install the latest Windows 11 feature update.	CRITICAL
Needs attention	**Security updates installed recently** Last update installed Aug 29, 2026 (48 days ago). **How to fix:** Settings > Windows Update > Check for updates, install everything, and restart.	HIGH
Pass	**Secure Boot is on** Secure Boot is enabled.	MEDIUM
Needs attention	**No restart waiting to finish updates** A restart is pending to finish installing updates. **How to fix:** Restart the computer.	LOW

Data & network

STATUS	CHECK	RISK
Action required	**Hard drive is encrypted (BitLocker)** C: is NOT encrypted. **How to fix:** Turn on BitLocker (Settings > Privacy & security > Device encryption, or Control Panel > BitLocker) and save the recovery key somewhere safe OFF the computer.	HIGH
Action required	**Firewall is on for every network type** Firewall is OFF for: Public **How to fix:** Windows Security > Firewall & network protection > turn on the firewall for Domain, Private and Public networks.	HIGH
Pass	**Old file-sharing protocol (SMBv1) is off** SMBv1 is disabled.	HIGH
Needs attention	**Remote Desktop is secured** Remote Desktop is ON (with Network Level Authentication). **How to fix:** If not needed, turn it off (Settings > System > Remote Desktop). If needed, make sure port 3389 is NOT open on the router - use a VPN instead.	HIGH
Pass	**No risky services listening on the network** None of the commonly abused services are listening.	MEDIUM

STATUS	CHECK	RISK
Needs attention	**USB AutoRun is disabled** AutoPlay is enabled for removable media. **How to fix:** Settings > Bluetooth & devices > AutoPlay > turn off "Use AutoPlay for all media and devices".	LOW

Accounts & passwords

STATUS	CHECK	RISK
Pass	**Guest account is disabled** Guest account is disabled.	HIGH
Needs attention	**Everyday account is not an administrator** The current user (FRONTDESK-01\reception) is an administrator. Admins: FRONTDESK-01\itadmin, FRONTDESK-01\reception **How to fix:** Create a separate admin account for installs, and change the everyday account to a Standard user (Settings > Accounts > Other users).	HIGH
Pass	**User Account Control (UAC) is on** UAC is on.	HIGH
Pass	**Built-in Administrator account is disabled** Built-in Administrator account is disabled.	MEDIUM
Action required	**Password minimum length** No minimum password length is set (blank passwords allowed). **How to fix:** Set a minimum of 12 characters: run as admin net accounts /minpwlen:12 (or via Group Policy / Intune for business accounts).	MEDIUM
Needs attention	**Account lockout after failed logins** Accounts never lock out after failed passwords. **How to fix:** Run as admin: net accounts /lockoutthreshold:10 /lockoutduration:15 /lockoutwindow:15	MEDIUM
Needs attention	**Screen locks automatically when idle** No automatic idle lock of 15 minutes or less was found. **How to fix:** Settings > Accounts > Sign-in options > "If you've been away, when should Windows require you to sign in again?" = When PC wakes; and set screen off after 10 minutes or less.	MEDIUM
Needs attention	**No stale local accounts** Enabled but unused 90+ days: frontdesk2 **How to fix:** Disable or delete local accounts that are no longer used (Computer Management > Local Users and Groups).	LOW

STATUS	CHECK	RISK
Needs attention	**PowerShell activity logging** Script block logging is not enabled. **How to fix:** Enable via Group Policy: Administrative Templates > Windows Components > Windows PowerShell > Turn on PowerShell Script Block Logging.	LOW

Things to confirm together

These can't be checked automatically. Tick each one you can confirm.

- [ ] Important files are backed up automatically to at least one place OFF this computer (cloud or external drive).
- [ ] A backup has actually been restored as a test in the last 6 months.
- [ ] Email, banking and payroll accounts all use multi-factor authentication.
- [ ] Staff use a password manager instead of reusing passwords.
- [ ] Office Wi-Fi uses WPA2/WPA3 with a strong password, and visitors use a separate guest network.
- [ ] The router admin password was changed from the default and its firmware is up to date.
- [ ] Accounts of former employees were disabled on their last day.
- [ ] Staff know how to spot phishing emails and who to call if they click something suspicious.
- [ ] There is a written plan for what to do if ransomware hits (who to call, where backups are).

Next steps
Arauza Tech Security can fix the items above and keep this computer monitored and updated every month. Contact: hello@arauzatech.com | arauzatech.com

This report reflects settings found on October 16, 2026 on one computer and is not a guarantee against all threats. The assessment was read-only: no settings were changed. Security Checkup v1.0.0.
